(54) Title: LOGIC ANALYZER DATA PROCESSING METHOD

(57) Abstract: A logic analyzer data processing method used in a logic analyzer (10) having a control circuit (17) adapted to read in test data from a test sample (13), a memory (18) controlled by the control circuit (17) to store the test data received from the test sample (13), and a display (161) adapted to display the test data fetched by the control circuit (17) from the memory (18), the method including the step of enabling the control circuit (17) to drive a compressor (19) to compress the test data received from the test sample (13) before storing it in the memory (18), and to depress the compressed test data before transmitting it from the memory (18) to the display (161).

LOGIC ANALYZER DATA PROCESSING METHOD

BACKGROUND OF THE INVENTION

1. Field of the Invention:

The present invention relates to logic analyzers and, more
5 specifically, to logic analyzer data processing method, which
decompresses test data obtained from test samples before storing in
memory so that memory can store more test data.

2. Description of the Related Art:

FIG. 1 illustrates the arrangement of a logic data analyzer
10 according to the prior art. The logic analyzer comprises a logic
analyzer main unit 10'. The logic analyzer main unit 10' comprises
detection devices 11'. Each detection device 11' has multiple
lead-wires 111' and a clip 113' at the end of each lead-wire 111' for
fastening to a respective pin of the test sample (for example, digital
15 circuit). The detection devices 11' detect high/low potential status
of every pin of the test sample at a fixed time interval, and then
transmit test data to a computer 16' through a transmission
interface (for example, USB interface, LPT interface, or the like)
15, enabling test data to be displayed on the display screen 161' of
20 the computer 16'. FIG. 2 is a system block diagram of the prior art
logic data analyzer. The logic analyzer main unit 10' comprises a
control circuit 17' and a memory (for example, SRAM) 18'. When
received test data from the test sample 13', the control circuit 17'

stores received test data in the memory 18'. When the memory space of the memory 18' used up, the control circuit 17' fetches storage test data from the memory 18', and then transmits fetched test data to the computer 16' through the transmission interface 15' for display on the display screen 161' of the computer 16'. Because the memory 18' has a limited data storage space, it may not be able to store a complete series of test data. When the user debugging the digital circuit (test sample) based on an incomplete test result, the debugging work may take much time, or may be unable to proceed.

10 Therefore, it is desirable to provide a logic analyzer data processing method that eliminates the aforesaid problem.

SUMMARY OF THE INVENTION

The present invention has been accomplished under the circumstances in view. It is therefore the main object of the present invention to provide a logic analyzer data processing method, which compresses the test data obtained from the test sample before storing it in the memory, so that the test data can be stored in less space in the memory.

20 According to one aspect of the present invention, the logic analyzer data processing method is used in a logic analyzer having a control circuit adapted to read in test data from a test sample, a memory controlled by the control circuit to store the test data received from the test sample, and a display adapted to display the

test data fetched by the control circuit from the memory, the method including the step of enabling the control circuit to drive a compressor to compress the test data before storing in the memory. According to another aspect of the present invention, the control
5 circuit is controlled to drive the compressor to depress the compressed test data before transmitting it from the memory to the display.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 illustrates the arrangement of a logic analyzer
10 according to the prior art.

FIG. 2 is a system block diagram of the logic data analyzer according to the prior art.

FIG. 3 is a system block diagram of a logic data analyzer according to the present invention.

15 FIG. 4 is an operational flow chart of the present invention.

FIG. 5 is a system block diagram of an alternate form of the logic data analyzer according to the present invention.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

Referring to FIG. 3, the logic analyzer main unit,
20 referenced by 10, comprises a control circuit 17, a memory 18 (for example SRAM), and a compressor 19. When received the test data of the test sample 13, for example, a digital circuit, the control circuit 17 transmits the received test data to the compressor 19,

which compresses the test data to reduce its size, so that the compressed test data can be stored in less space in the memory 18. When the memory space of the memory 18 used up (fully occupied by storage data), the control circuit 17 fetches the storage data
5 from the memory 18, and then directly transmits the fetched data to the computer 16 through the transmission interface 15 for display on the display panel 161 of the computer 16. The control circuit 17 may control the compressor 19 to decompress the data fetched from the memory 18 before sending it to the computer 16.

10 Referring to FIG. 4 and FIG. 3 again, the control circuit 17 works subject to the steps bellows:

- (301) At first, read in the test data transmitted from the test sample 13 (the test data includes high/low potential status of every pin of the test sample 13 at a fixed time interval);
- 15 (302) Transmit the test data to the compressor 19, and then drives the compressor 19 to compress the test data, so as to reduce the size of the test data;
- (303) Store the compressed test data in the memory 18;
- (304) Determine if the memory space of the memory 18 has been
20 used up (fully occupied) or not, and then proceed to step (305) if positive; or return to step (301) if negative;
- (305) Fetch the compressed test data from the memory 18, and then drive the compressor 19 to decompress the compressed

test data (the data decompression process may be eliminated);

(306) Transmit the fetched (or decompressed) test data through the transmission interface 15 to the computer 16 for display on the display panel 161 of the computer 16 for reference.

According to the aforesaid description, the test data obtained from the test sample is compressed to reduce the size, so that the compressed test data can be stored in less space in the memory 18. Therefore, the memory 18 can store more test data.

FIG. 5 shows an alternate form of the present invention. According to this embodiment, the logic analyzer main unit 10 comprises a control circuit 17, a memory 18 (for example SRAM), a compressor 19, and a display panel 161. When received the test data from the test sample 13, the control circuit 17 transmits the received test data to the compressor 19, which compresses the test data to reduce its size, so that the compressed test data can be stored in less space in the memory 18. When the memory space of the memory 18 used up (fully occupied by storage data), the control circuit 17 fetches the storage data from the memory 18, and then drives the compressor 19 to decompress the data fetched from the memory 18, and then transmits the decompressed data to the display panel 161 for display.

A prototype of logic analyzer data processing method has

been constructed with the features of the annexed drawings of FIGS. 3~5. The logic analyzer data processing method functions smoothly to provide all of the features discussed earlier.

Although particular embodiments of the invention have
5 been described in detail for purposes of illustration, various modifications and enhancements may be made without departing from the spirit and scope of the invention. Accordingly, the invention is not to be limited except as by the appended claims.

What the invention claimed is:

1. A logic analyzer data processing method used in a logic analyzer, which comprises a control circuit adapted to read in test data from a test sample, a memory controlled by said control circuit
5 to store the test data received from said test sample, and display means adapted to display the test data fetched by said control circuit from said memory, the method comprising the step of enabling said control circuit to drive a compressor to compress the test data received from said test sample before storing the test data
10 in said memory.

2. The logic analyzer data processing method as claimed in claim 1, wherein said test sample is digital circuit.

3. The logic analyzer data processing method as claimed in claim 2, wherein the test data from said test sample includes
15 high/low potential status of every pin of said test sample at a fixed time interval.

4. A logic analyzer data processing method used in a logic analyzer, which comprises a control circuit adapted to read in test data from a test sample, a memory controlled by said control circuit
20 to store the test data received from said test sample, and display means adapted to display the test data fetched by said control circuit from said memory, the method comprising the step of enabling said control circuit to drive a compressor to compress the

test data received from said test sample before storing the test sample in said memory, and to depress the compressed test data before transmitting from said memory to said display means.

5. The logic analyzer data processing method as claimed
5 in claim 4, wherein said test sample is a digital circuit.

6. The logic analyzer data processing method as claimed in claim 5, wherein the test data from said test sample includes high/low potential status of every pin of said test sample at a fixed time interval.
